

1. Preface

Why Common DC bus?

In the current of electrical transmission, variable-frequency drive applications are very common. Because of the way technology, types of loads and driving device, and so on for various reasons, regenerative energy phenomena occur frequently. In General inverter, regeneration of energy most commonly used treatment method, there are two : (1) Transformation of mechanical energy into electrical energy and eventually into the braking resistor in a DC loop, and then spilled out after converted to thermal energy, called power braking. (2)bring it back to the mains. DC common bus is based on the principle of universal converter uses the AC-DC-AC frequency conversion, while when the motor is brake, the braking energy back into the DC side, in order to better deal with feedback of braking energy, people used to connect the inverter at DC side. For example, when a drive is at braking state and another drive in a motor to accelerate State, so that energy can complement each other.

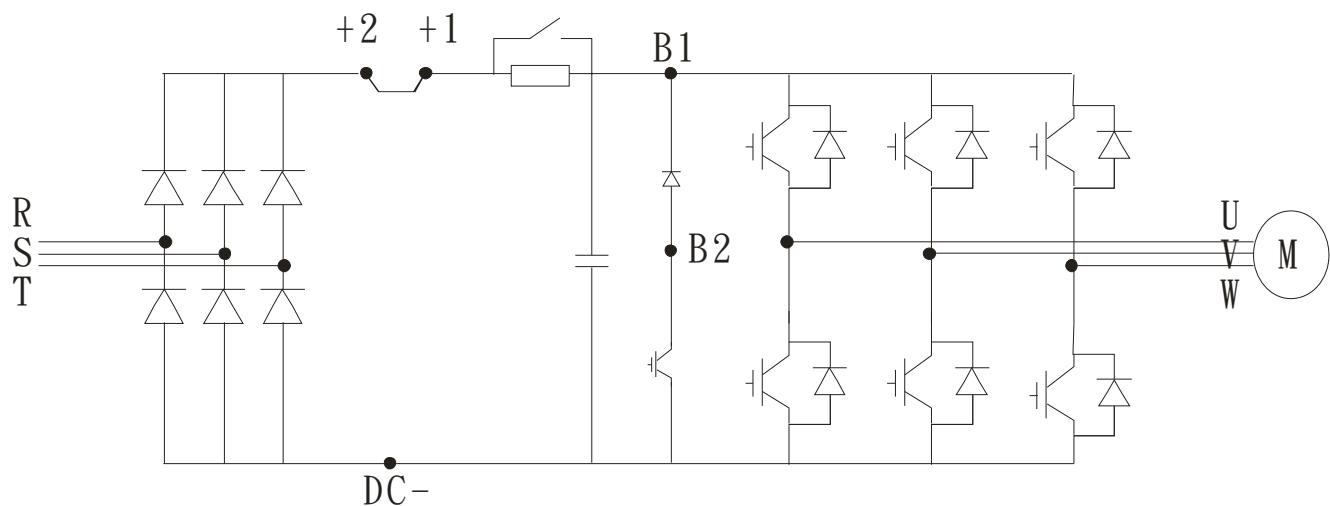

In addition, the energy savings in the current era is a serious and most commonly discussed topics. Drive expected to complete the work, must also take into account the overall system to reduce electricity consumption. At this point, common DC bus of the manner in which they are beginning to be widely used to discuss and research. Delta VFD-C family motor drives are therefore apply a common DC bus as a responsibility that must be completed.

Chapter_1 VFD-C family circuit diagram

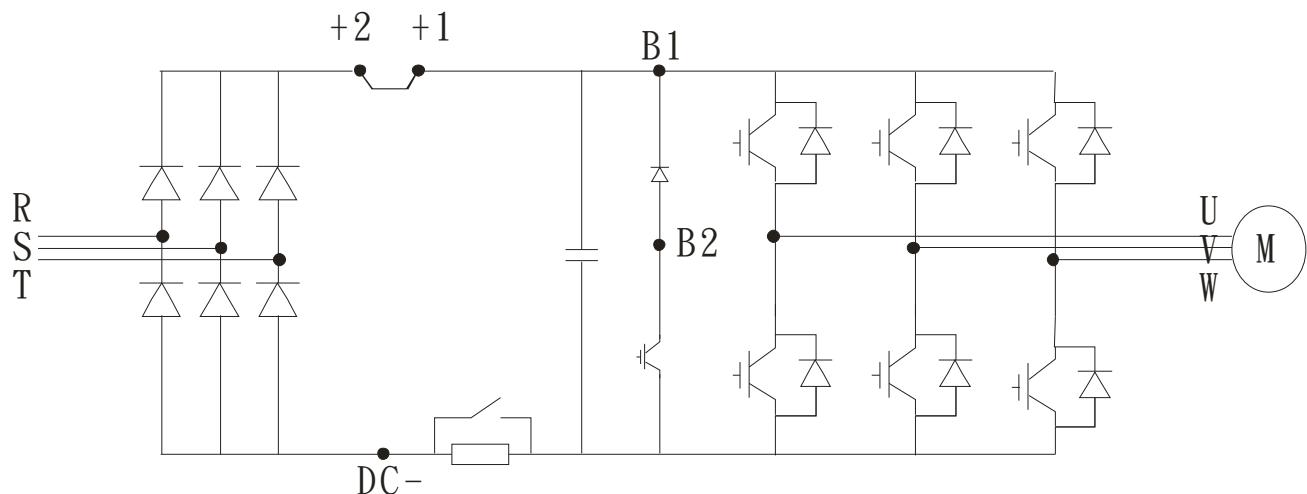

The frame A0 to frame H of VFD- C family drive, the DC+ and DC- terminals are designed in front of the soft start circuit. Therefore, Delta VFD-C family on the application of common DC bus, there are several ways of wiring can be used.

The VFD-C2000, VFD-CH2000, VFD-CP2000 circuit diagrams are as below:

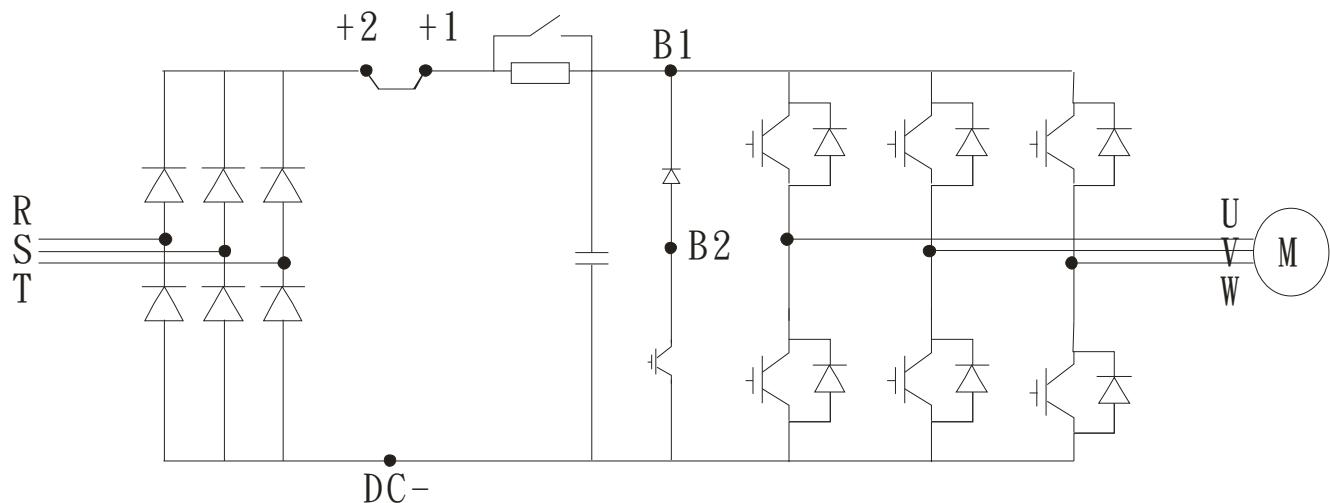

Frame A

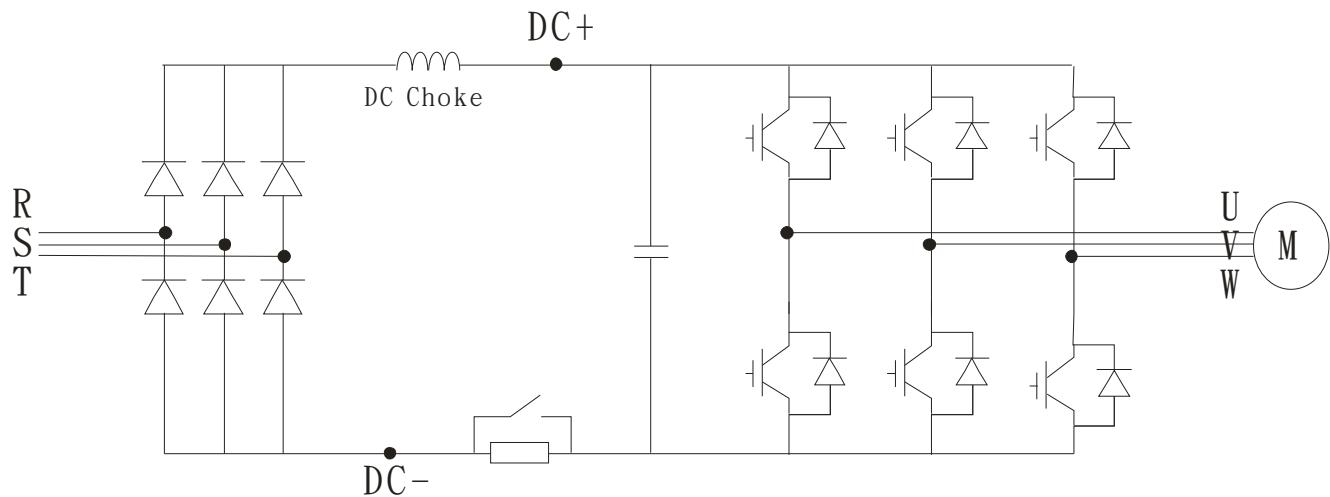

Frame B

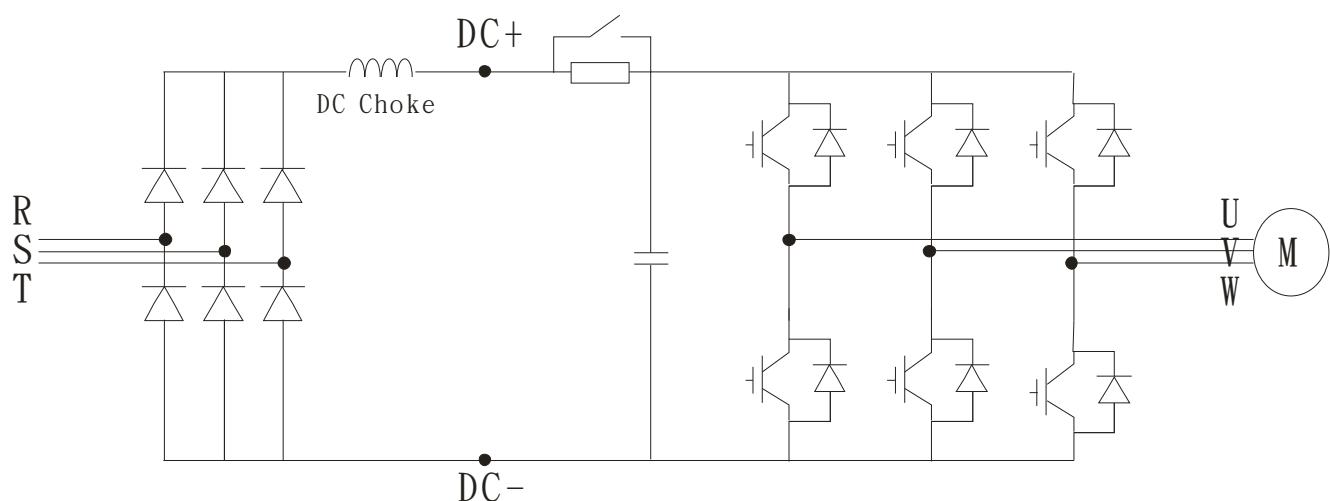

Frame C

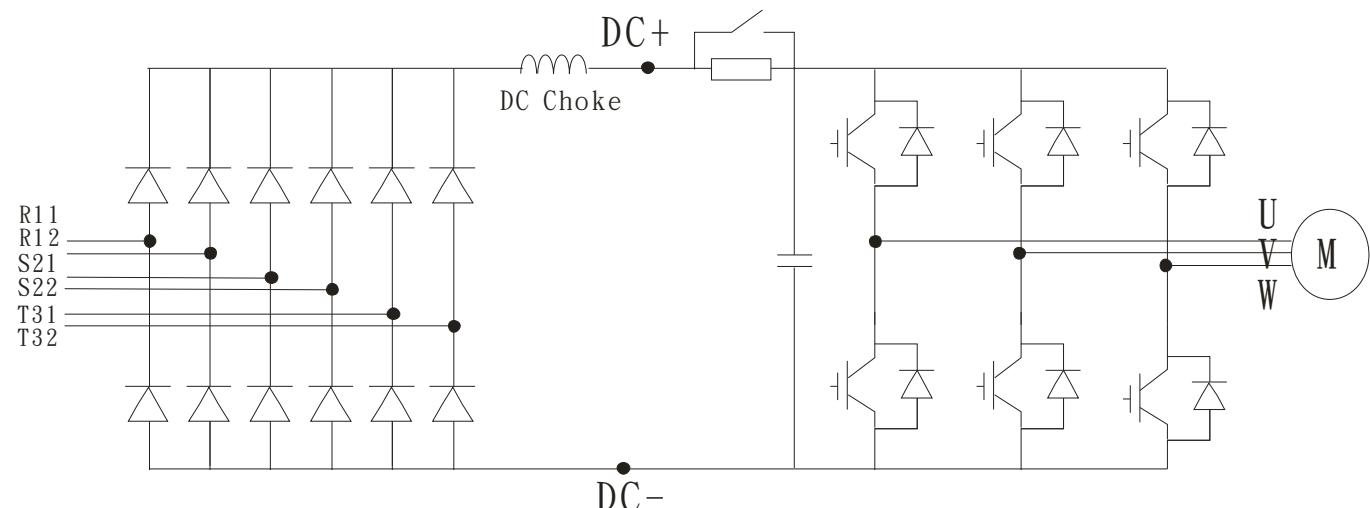

Frame D~E

Frame F

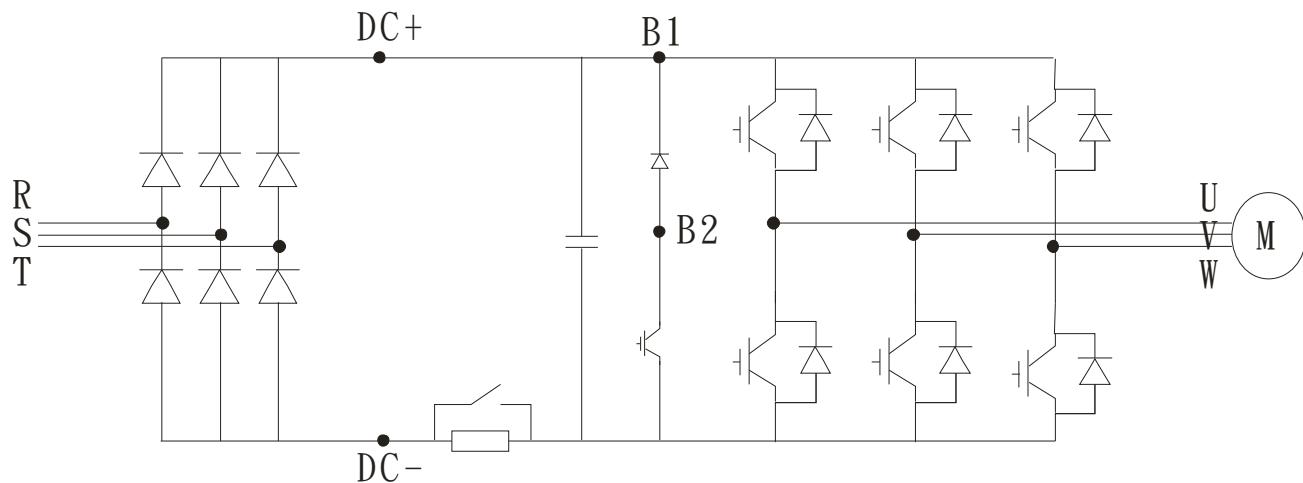

Frame G 及 H

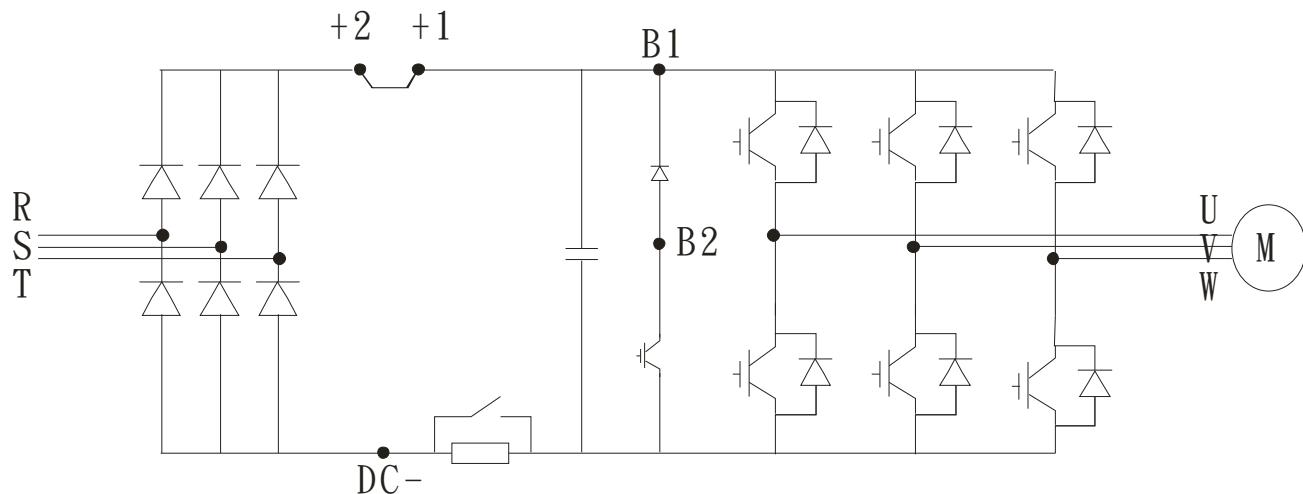

The VFD-C200 circuit diagrams are as below:

Frame A0

Frame A

VFD-C family power range and frame size table

		Frame A0	Frame A	Frame B	Frame C	Frame D
C200	230V 1Φ	0.5~3HP				
	230V 3Φ	0.5~5HP				
	460V	1HP~5HP(3.7kW)	5HP(4kW)~10HP			
C2000	230V		1~5HP	7.5~15HP	20~30HP	40~50HP
	460V		1~7.5HP	10~20HP	25~40HP	50~100HP
CH2000	230V		1~5HP	7.5~15HP	20~25HP	30~50HP
	460V		1~7.5HP	10~20HP	25~40HP	50~100HP
CP2000	230V		1~7.5HP	10~20HP	25~40HP	50~60HP
	460V		1~10HP	15~25HP	30~50HP	60~125HP

		Frame E	Frame F	Frame G	Frame H
C2000	230V	60~100HP	125HP		
	460V	125~150HP	175~215HP	250~300HP	375~465HP
CH2000	230V	60~75HP	100HP		
	460V	125~150HP	175HP	215~300HP	375HP

		Frame E	Frame F	Frame G	Frame H

	460V	150~175HP	215~250HP	300~375HP	425~536HP

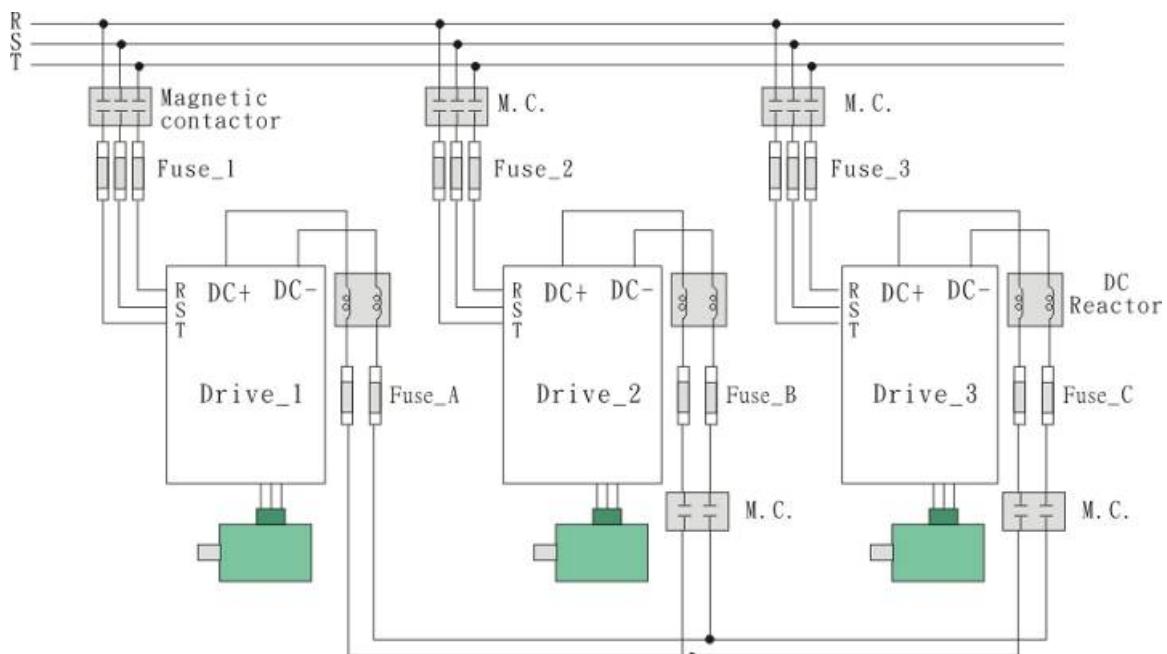

Chapter_2: Share AC power and Common DC Bus

Wiring method 2.1: Drive 1 to drive 3 the power level is the same

Note: Adding 3-phase Line reactor for proportional current sharing

Wiring method 2.2: Drive 1 to drive 3 in the power level is not the same.

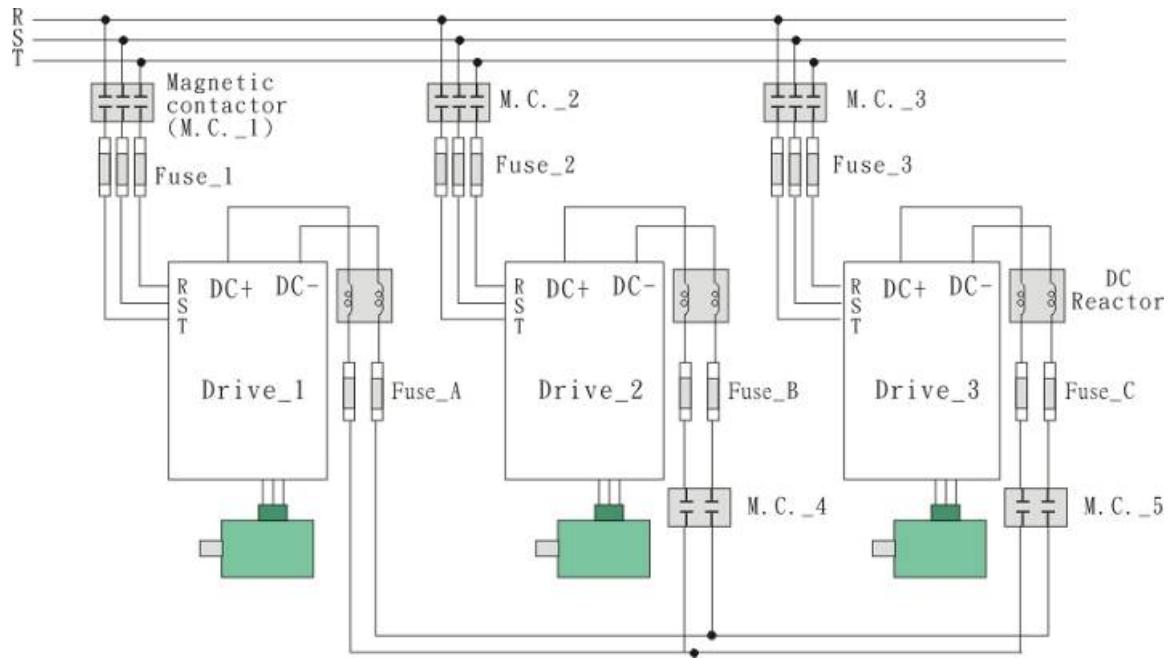

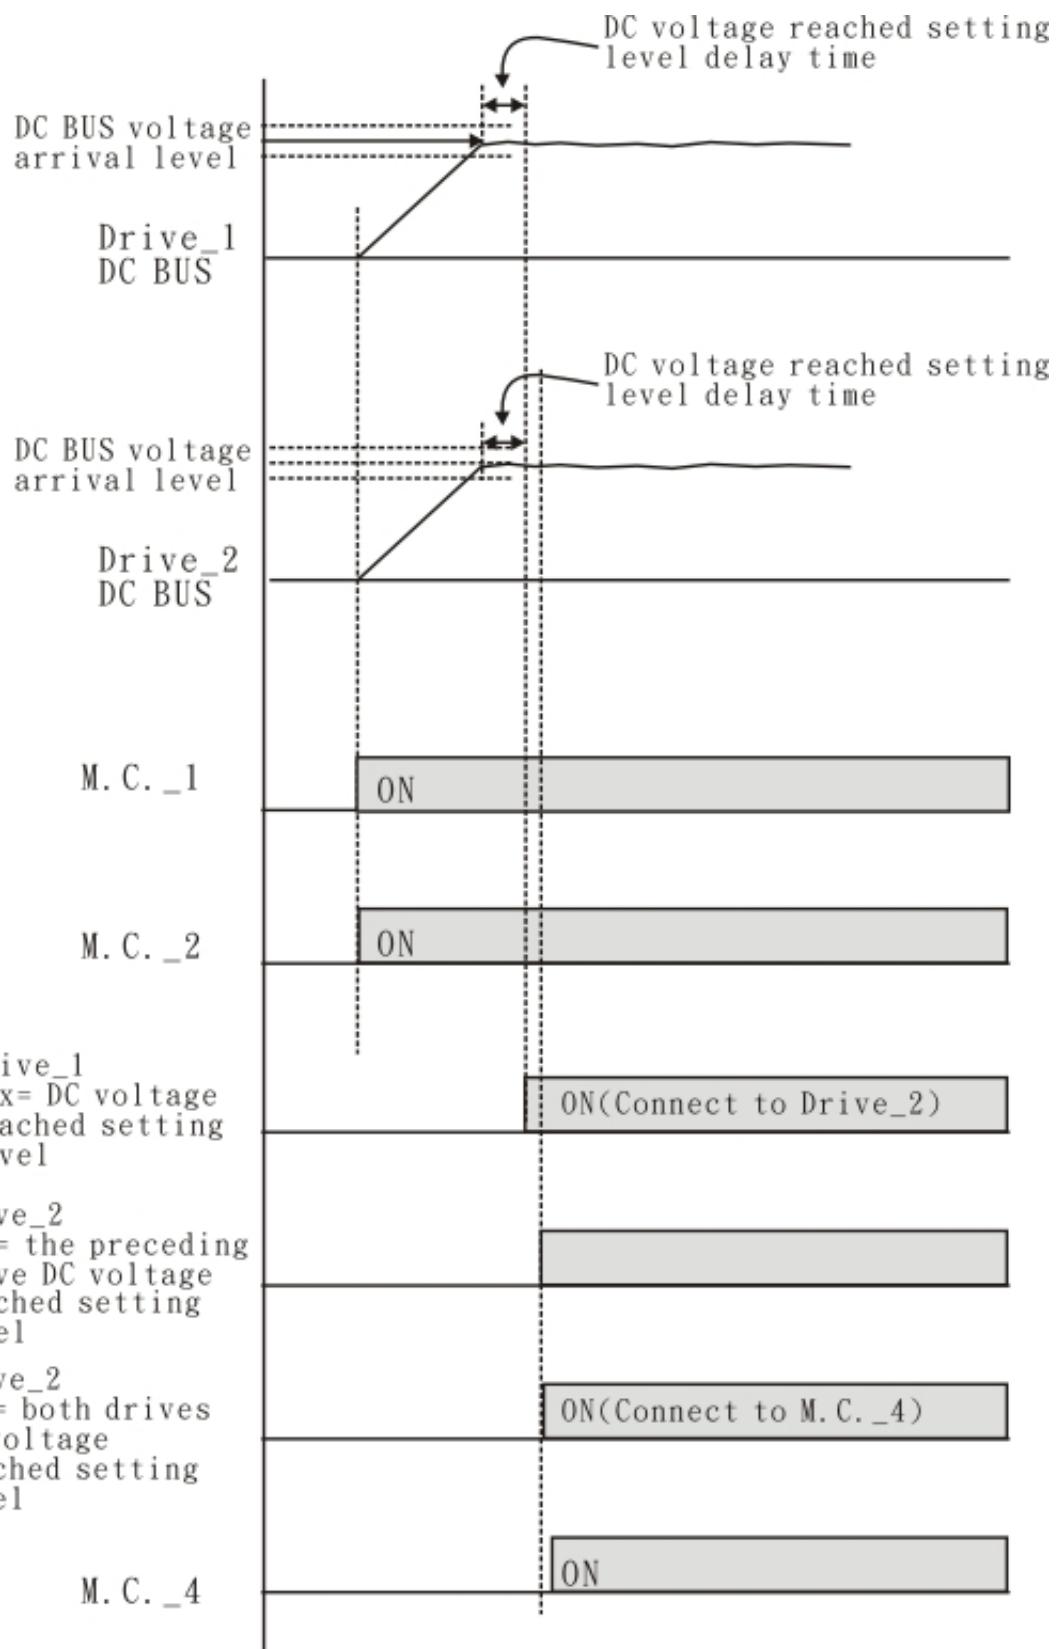

Note: Installing DC reactor for DC-side achieve the proper current sharing.

- On the charged issue, each drive both side of the AC power input and the DC side required the installation of electromagnetic contactor
- When the larger power frame drive is loaded, the current through the small power drive may exceed its current rating. To prevent this, please install DC reactor for DC-side achieve the proper current sharing.
- When using a common DC bus, make DC circuit inductance as small as possible is imperative. To installs

each AC motor drive as close to each other as possible.

- When share AC power and Common DC Bus, the turn ON sequence of each electromagnetic contactor:

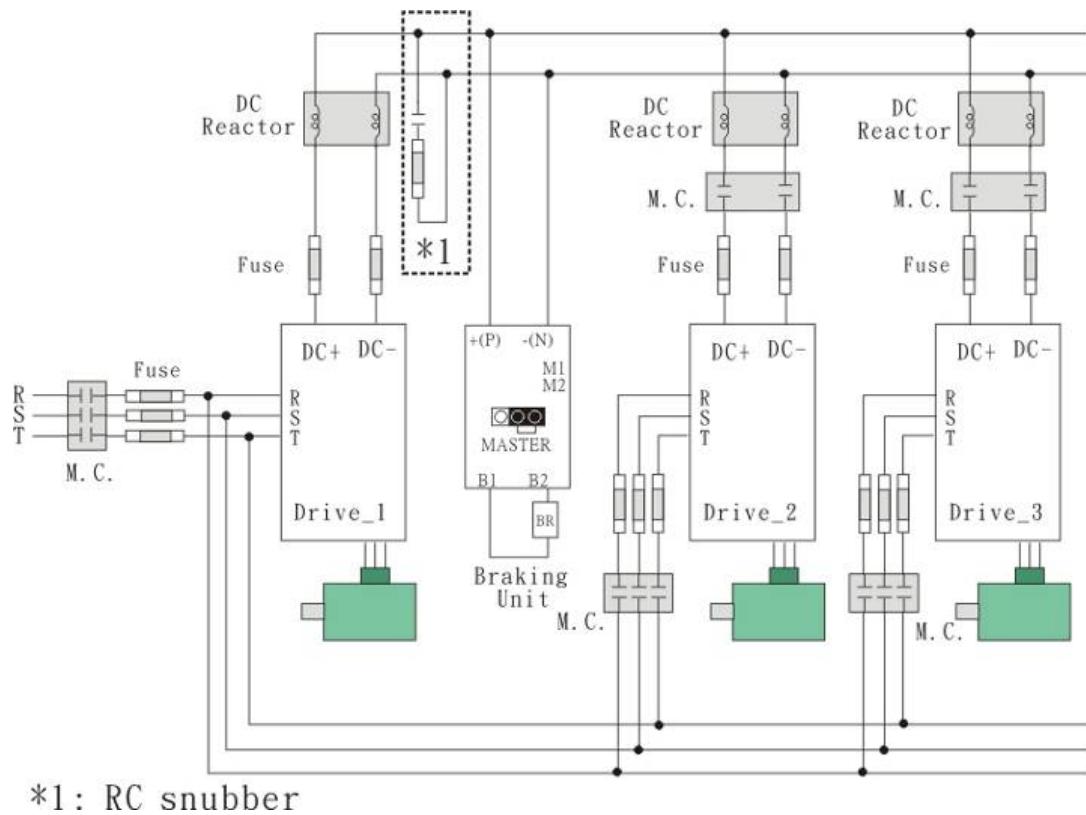

Note: The electromagnetic contactor's On and Off can only control via controller such as PLC.

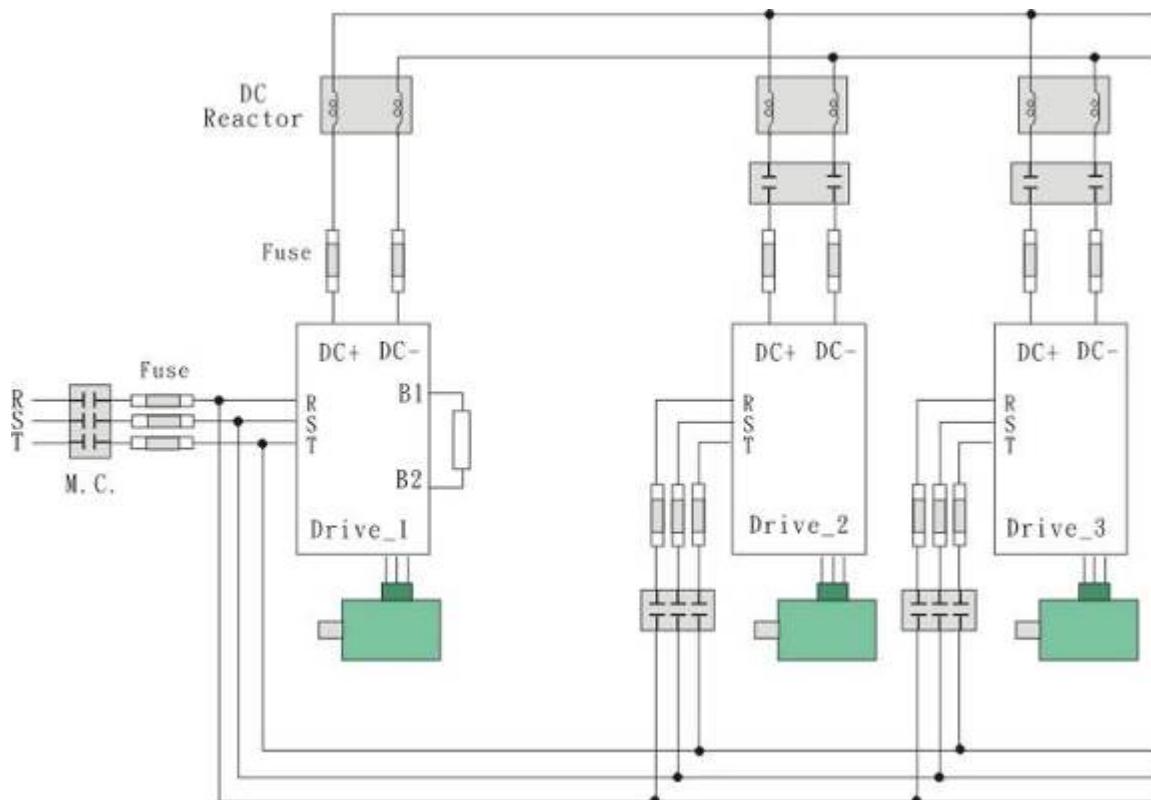

Chapter_3: Share AC power and Common DC Bus: collocated with DC side regenerated voltage adjustment device

Wiring method 3.1 : Use optional braking unit

*1: RC snubber

Wiring method 3.2 : Use built in braking transistor

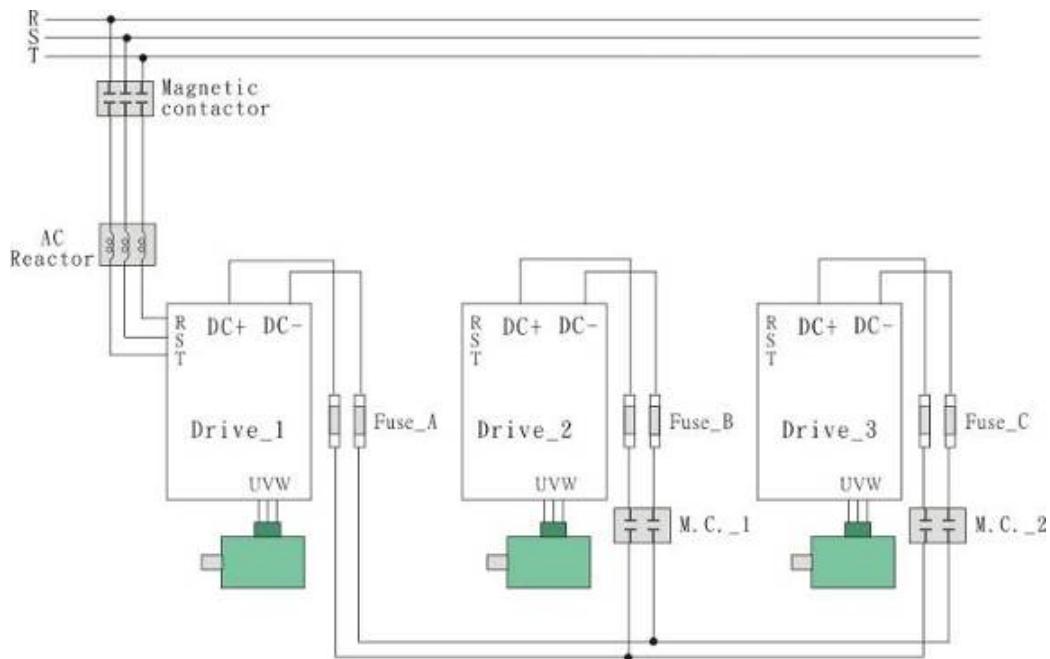

- The braking unit must be connected closest to the supply drive(biggest power level drive). If the drives are at the same power level, to install braking unit close to the drive which have the most regenerated power.
- When a vibration is happened in the system, an RC Snubber circuit is required.
- About the pre-charging issue, the electromagnetic contactor are required in both AC and DC side of each drive.
- About the loading, when the larger power frame drive is loaded, the current through the small power drive may exceed its current rating. To prevent this, please install DC reactor for DC-side achieve the proper current sharing.
- When using a common DC bus, make DC circuit inductance as small as possible is imperative. To installs each AC motor drive as close to each other as possible.
- If AC power is removed from one drive in shared AC /DC bus, this drive can still be charging through the DC bus of another drive. Thus, AC power to all of the drive should be provided through a common disconnected switch or circuit breaker.

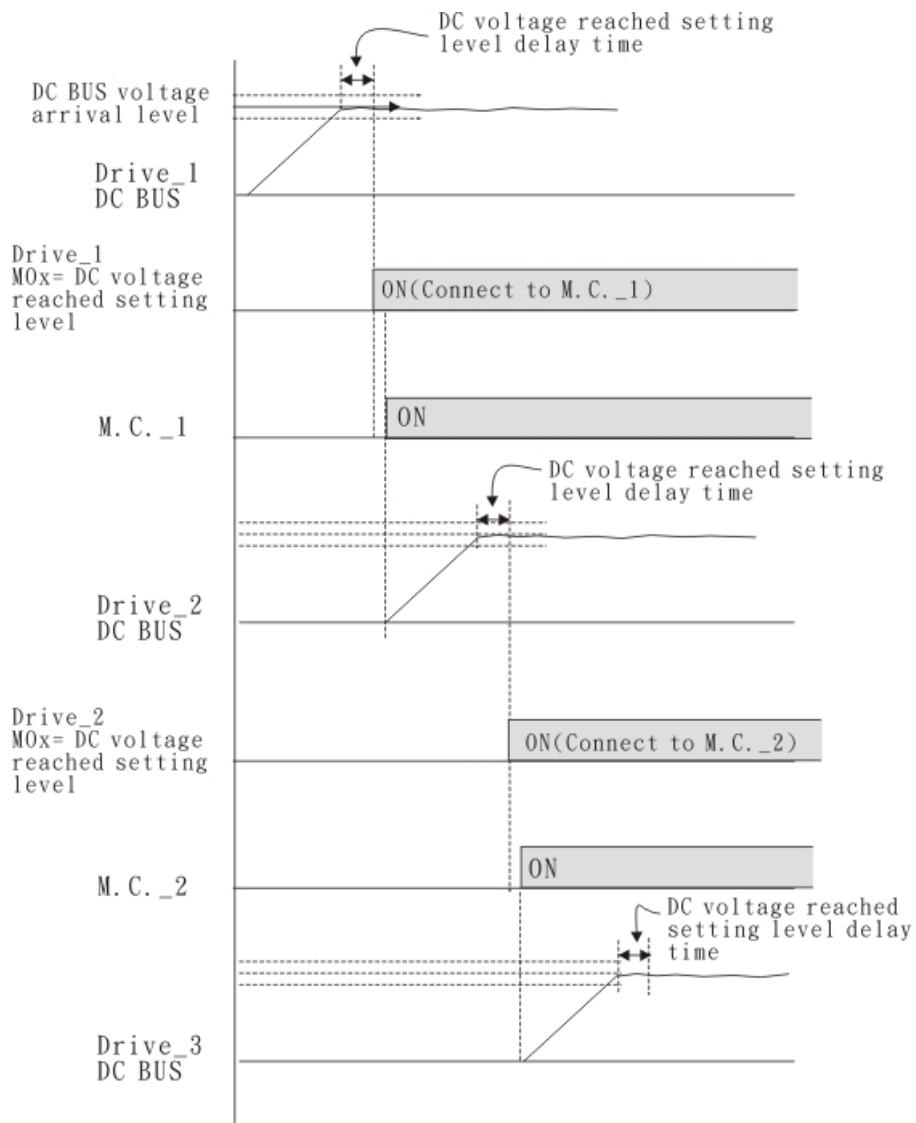

Drive	Voltage	Braking chopper
C2000	230V	Built-in: frame A~C(1HP~30HP) Optional: frame D~H(40HP~125HP)
	460V	Built-in: frame A~C(1HP~40HP) Optional: frame D~H(50HP~475HP)
CH2000	230V	Built-in: frame A~C(1HP~25HP) Optional: frame D~H(30HP~100HP)
	460V	Built-in: frame A~C(1HP~40HP) Optional: frame D~H(50HP~375HP)
CP2000	230V	Built-in: frame A~C(1HP~30HP) Optional: frame D~H(40HP~125HP)
	460V	Built-in: frame A~C(1HP~50HP) Optional: frame D~H(60HP~536HP)
C200	230V	All series built-in: frame A0~A(0.5HP~5HP)
	460V	All series built-in: frame A0~A(1HP~10HP)

Chapter_4: Common DC Bus

Wiring method 4.1 :

When share AC power and Common DC Bus, the turn ON sequence of every M.C. as below:

- Main power is always connecting to biggest drive and its charging circuit must capable of charging the whole DC Bus.
- As the rectifier circuit with charge circuit design is a mix of. So, if you wish to use this wiring method, to avoid the first drive of the rectifier's life is shortened due to overheating, the sum of all drives current output cannot be greater than the rated current of the first drive. For example, the 3 drives' power range are 90kW(normal duty rated current is 180A); 37kW(normal duty rated current is 73A) and 1.5kW(normal duty rated current is 5.9A).
 $(73A + 5.9A) * 1.3 = 102.57A$. → take 103A
 The first drive output current shouldn't bigger than 180A - 103A = 77A
 If more output current is need, please connect the mains to 37kW drive.
- When using a common DC bus, make DC circuit inductance as small as possible is imperative. To installs each AC motor drive as close to each other as possible.
- The electromagnetic contactor's On and Off can only control via controller such as PLC.
- Before give Run command, please make sure that all the drive are completed on power on and have send a "Drive ready" signal to controller.

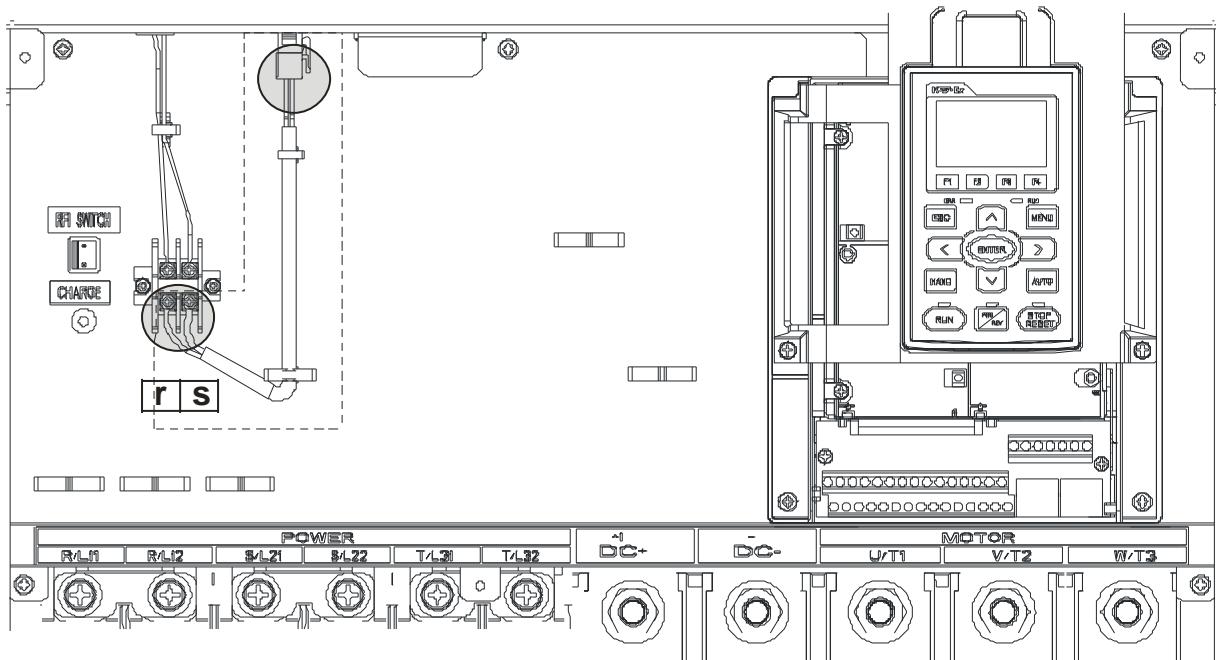

Applicable to Frame E~H

- When RST power is off, please disconnect terminal r and terminal s. (As circled in dotted line, uninstall the gray section and properly store cable r and cable s. Cable r and cable s are not available in optional accessories, do not dispose them.)

After terminal r and terminal s are cleared, user may now connect new power source to terminal r and terminal s. Please connect 220Vac for 220V model and 440 Vac for 440V model.

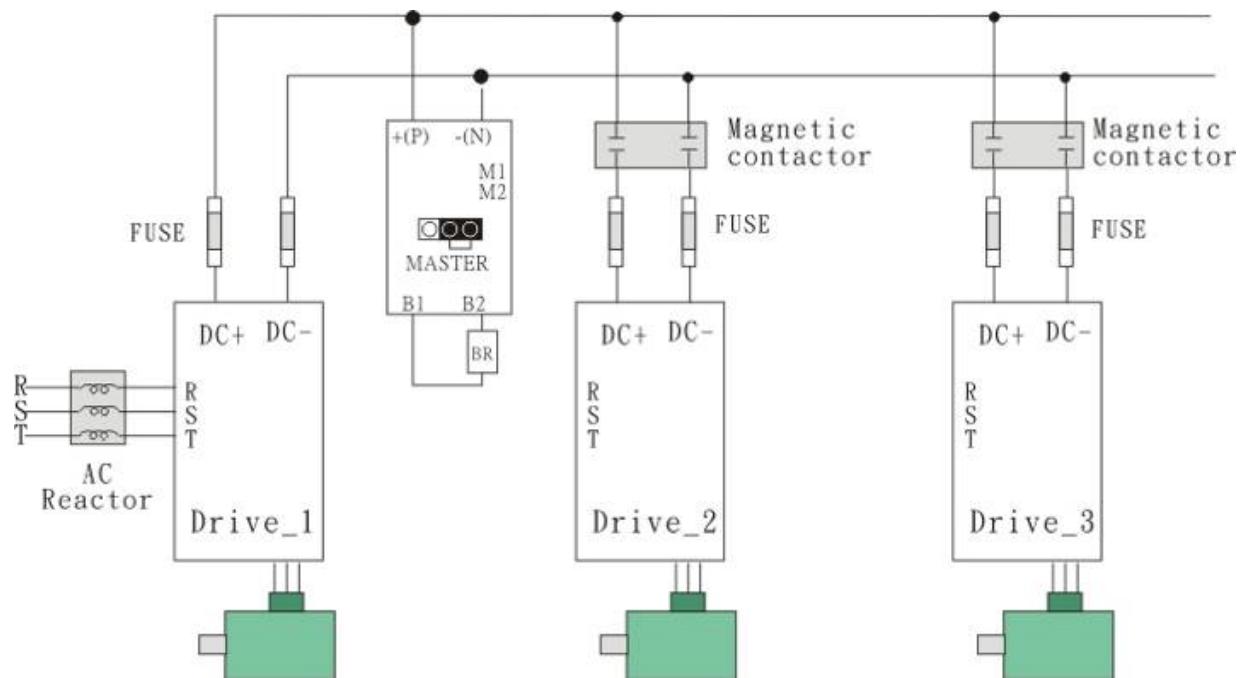

When the drive power is on, if terminal r and terminal s are not connected to new power source (220 Vac for 220V model and 440Vac for 440 V model), the digital keypad will display an error message "ryF".

- When DC Link is used as a DC Bus connection (RST power is applied), it is not required to remove terminal r and terminal s.

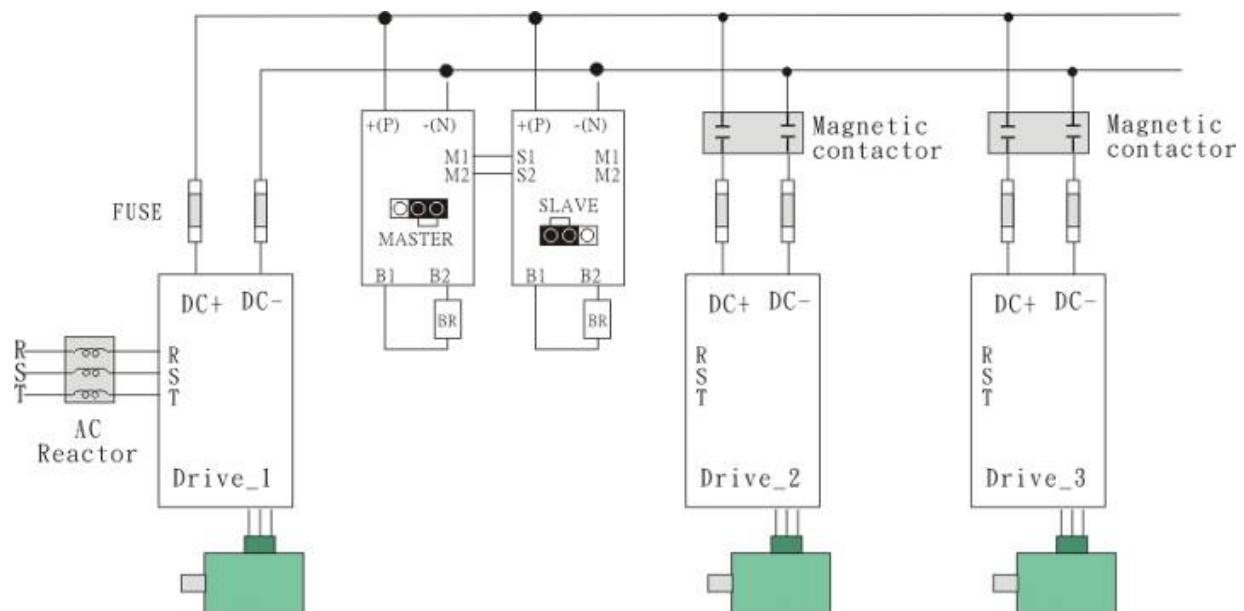

Chapter_5: Common DC Bus: collocated with DC side regenerated voltage adjustment device

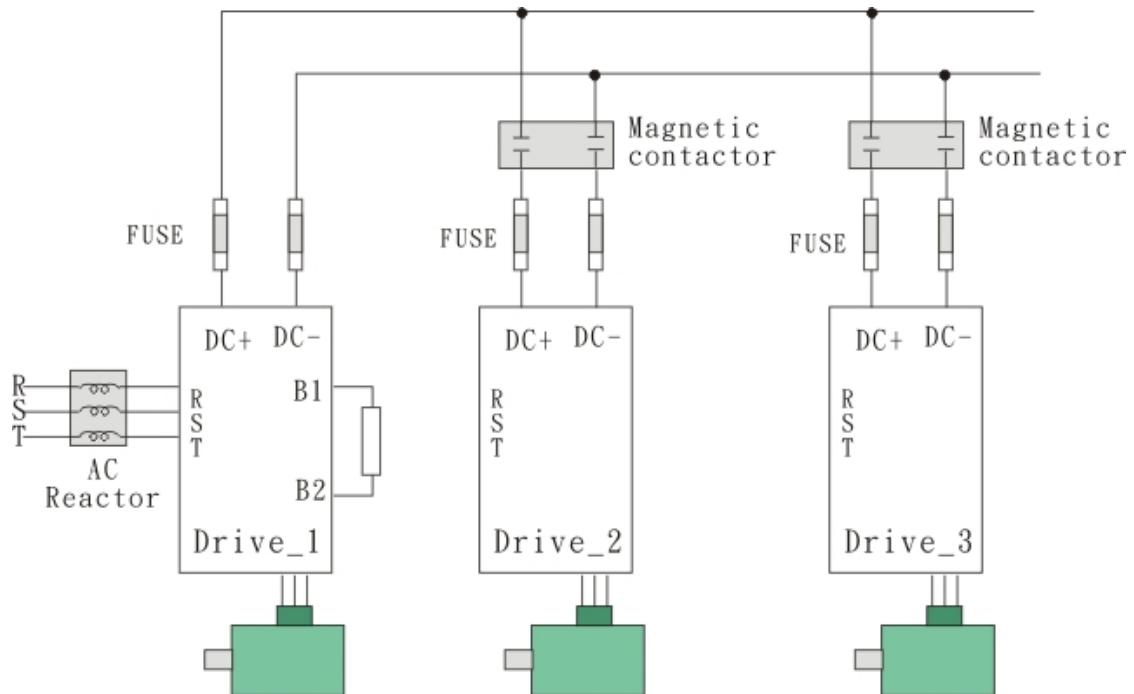

Wiring method 5.1 : use optional braking unit_1 unit

Wiring method 5.1 : use optional braking unit_2 unit

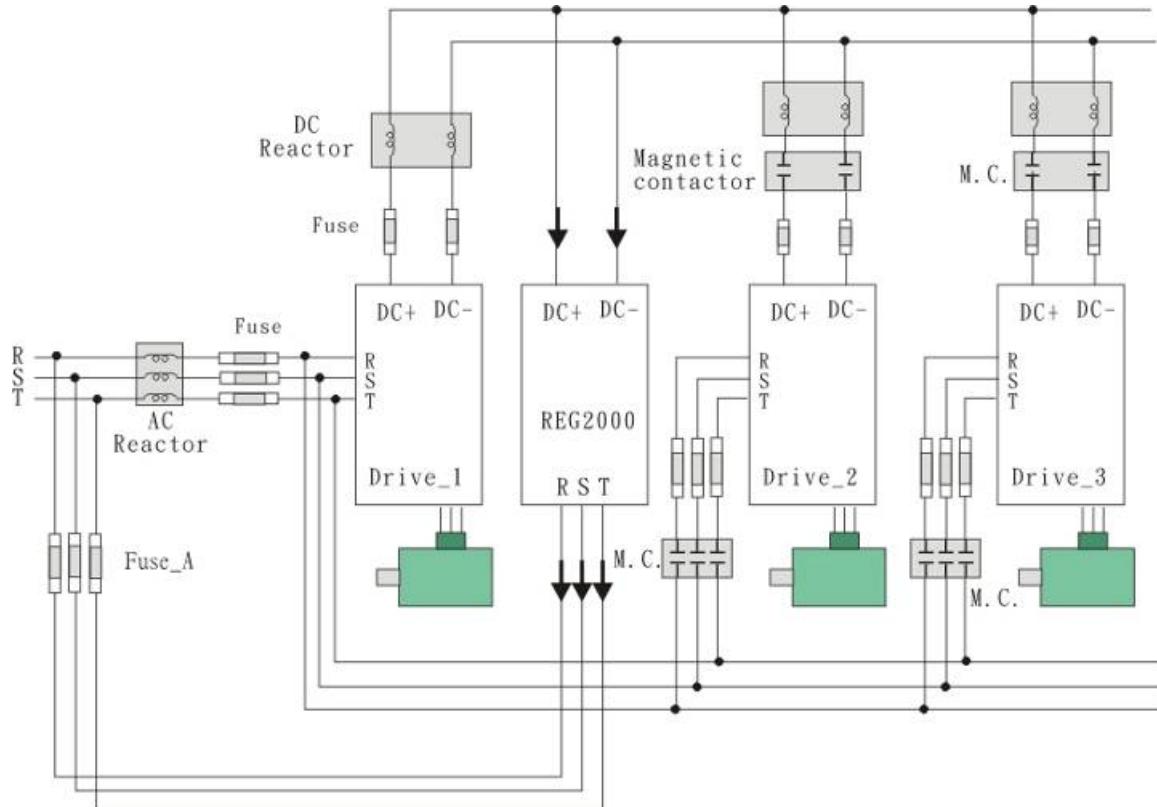

Wiring method 5.3 : Use built in braking transistor

- █ The braking unit must be connected closest to the supply drive(biggest power level drive). If the drives are at the same power level, to install braking unit close to the drive which have the most regenerated power.

Drive	Voltage	Braking chopper
C2000	230V	Built-in: frame A~C(1HP~30HP) Optional: frame D~H(40HP~125HP)
	460V	Built-in: frame A~C(1HP~40HP) Optional: frame D~H(50HP~475HP)
CH2000	230V	Built-in: frame A~C(1HP~25HP) Optional: frame D~H(30HP~100HP)
	460V	Built-in: frame A~C(1HP~40HP) Optional: frame D~H(50HP~375HP)
CP2000	230V	Built-in: frame A~C(1HP~30HP) Optional: frame D~H(40HP~125HP)
	460V	Built-in: frame A~C(1HP~50HP) Optional: frame D~H(60HP~536HP)
C200	230V	All series built-in: frame A0~A(0.5HP~5HP)
	460V	All series built-in: frame A0~A(1HP~10HP)

Chapter_6: Share AC power and Common DC Bus: collocated with power regenerated device_REG2000

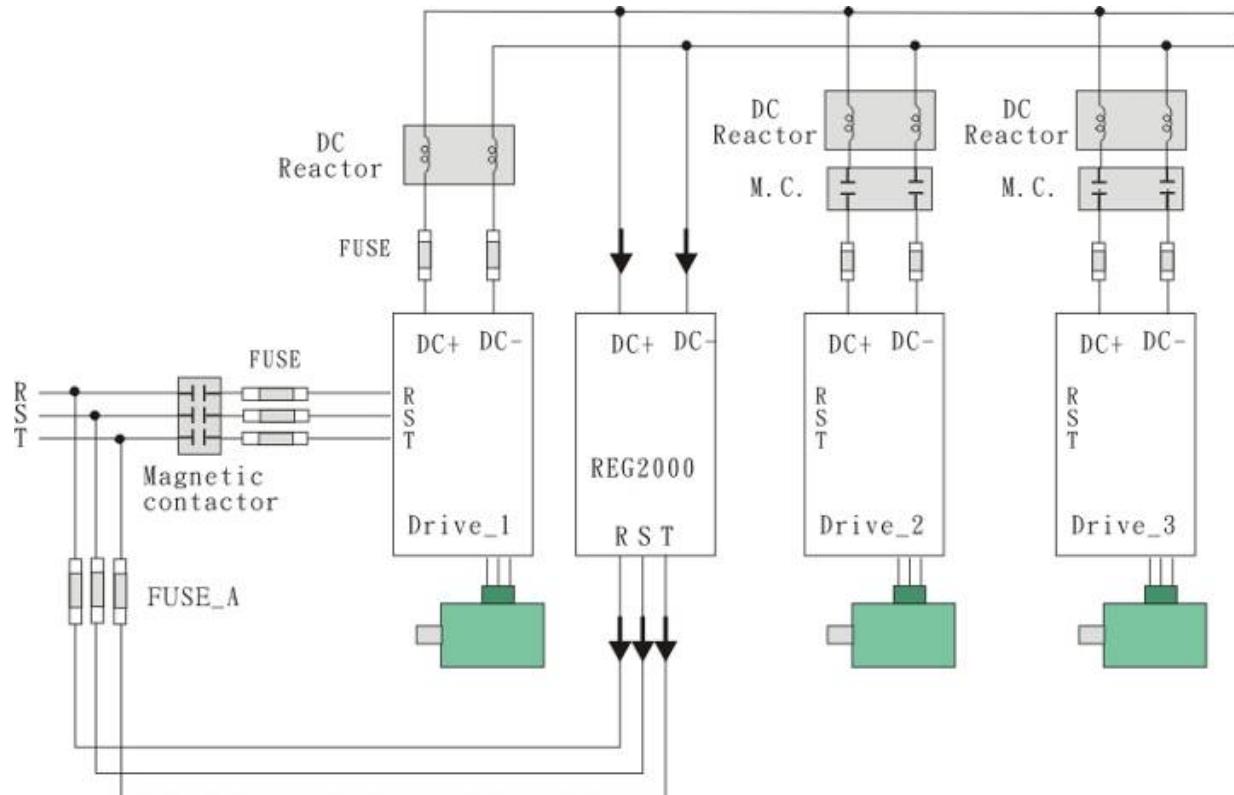

- When using generator, emergency power supply or transformer(same power capacity to AC motor drive) as power input, the REG2000 is not allow to run with this system. Please use braking resistor to dissipate regenerative energy.
- The cable length of DC+ and DC- to REG2000 should shorter than 5m.
- The Fuse_A spec. for REG2000 as below table:

Frame A	
Model No.	Amp
REG075A23A-21	50
REG110A23A-21	80
REG075A43A-21	25

Chapter_8: The selection of braking unit and braking resistor

For the common DC Bus system, to check whether it needs to be equipped with an additional brake unit or brake resistor, it will according to the total power of the common DC system is negative at any point of the duty cycle.

- ❖ From upon diagram, the total power of the common DC system is negative during T_2 to T_4 and T_6 to T_8 , therefore, a brake unit and brake resistor or REG2000 are needed.
- ❖ **To choose power size of the REG2000, brake unit and brake resistor, please refer to the selection software.**

Chapter_9: Common DC Bus: collocated with AFE2000

- (book icon) For one-to-many installation, the capacity of AFE2000 should bigger or equal to the total drive power capacity.
- (book icon) For one-to-many installation, installing a fuse on the AC motor drive's input side is recommended.
- (book icon) DC side fuse specification= AC rated input current/ 0.78×1.5

Chapter_10: Common DC Bus, recommend DC side fuse spec. as below table
